## RESEARCH & PROJECTS

### Improving Fairness of Large Language Models in Multi-document Summarization

Advisor: Snigdha Chaturvedi, University of North Carolina at Chapel Hill

Summary: To improve the fairness of summaries generated by LLMs, we propose FairPO, a preference tuning method based on DPO. To generate preference pair for tuning, the summaries are generated based on perturbed input document sets. To further improve the corpus-level fairness, we dynamically adjust the weights of each preference pairs.

### Coverage-based Fairness in Multi-Documents

Advisor: Snigdha Chaturvedi, University of North Carolina at Chapel Hill

Summary: To measure the fairness of summaries generated by LLMs, we propose a new summary-level fairness measure, Equal Coverage based on coverage of documents with different social attribute values. Equal Coverage addresses the redundancy issue faced by previous measures like Proportional Representation. We also propose a new corpus-level measure, Coverage Parity, which measures the corpus-level fairness in addition to Equal Coverage.

### Rationale-based Opinion Summarization

Advisor: Snigdha Chaturvedi, University of North Carolina at Chapel Hill

Summary: To improve the usefulness and interpretability of opinion summaries, we propose a new paradigm, Rationale-based Opinion Summarization, where each represented opinion is paired with a rationale that provides more details. To extract rationales for a representative opinion, we extract sentences based on four criteria: relatedness, specificity, popularity, and diversity.

### Aspect-aware Unsupervised Extractive Opinion Summarization

Advisor: Snigdha Chaturvedi, University of North Carolina at Chapel Hill

Summary: To ensure coverage of diverse aspects, we introduce an unsupervised extractive opinion summarization method that automatically identifies the aspects described in the review sentences and then extracts sentences based on their aspects. It identifies the underlying aspects of the review sentences using the roots of noun phrases and adjectives appearing in them. It then extracts review sentences of different aspects to form the summary.

### **Boosting few-shot abstractive summarization with auxiliary tasks**

Advisor: Hanfang Yang, Renmin University of China

Summary: To improve the sample efficiency, we develop 3 auxiliary tasks for each training sample in addition to the main task: sentence extraction, object prediction, and triple entailment. We then trained the abstractive summarization model with these tasks in a multi-task learning setting. In this project, I build the BART model for abstractive summarization, use adapters for multi-task learning, run experiments on Xsum, and write the paper.

### **Improving Zero and Few-Shot Abstractive Summarization with Intermediate Fine-tuning and Data Augmentation**

Advisor: Dragomir R. Radev, Yale University

Summary: To enable domain adaptation of summarization system with a few labeled samples, we generate pseudo-training pairs from the wiki dataset based on the characteristics of the target dataset such as abstractiveness. We also introduce back-translation and consistency loss to further improve the performance. In the project, I introduce consistency loss between original and augmented documents given pseudo-target summaries and write the paper.

### **Augmented Abstractive Summarization with Document-Level Semantic Graph**

Advisor: Hanfang Yang, Asso Prof. School of Statistics, Renmin University of China

Summary: To improve the performance of news summarization, we generate a graph of entities in each document using distant supervision to better model the relationship between entities. Then, we apply GNN to generate the entity embedding and integrate them into the summarization model using an attention mechanism. In the project, I construct the graph and write the paper.

### **Urban2Vec: Incorporating Street View Imagery and POIs for Multi-Modal Urban Neighborhood Embedding**

Advisor: Ram Rajagopal, Stanford University

Summary: To facilitate real estate recommendation and demographic surveys, we develop unsupervised methods to generate the embedding of neighborhoods based on the street view image and points of interest. To evaluate the effectiveness of our method, we use the embeddings to predict the demographic features of neighborhoods and run clustering on the embeddings. In the project, I design a way to combine image and text and design methods to evaluate its performance.
